Teachable Machine Screenshot Guide

Rock, Paper, Scissors image model workflow

Purpose: This document turns your screenshots into a clean, teacher-friendly walkthrough that can be uploaded to your GitHub repository or shared as a handout.

Audience: Teachers or students who need a simple visual guide to build and export a Teachable Machine model.

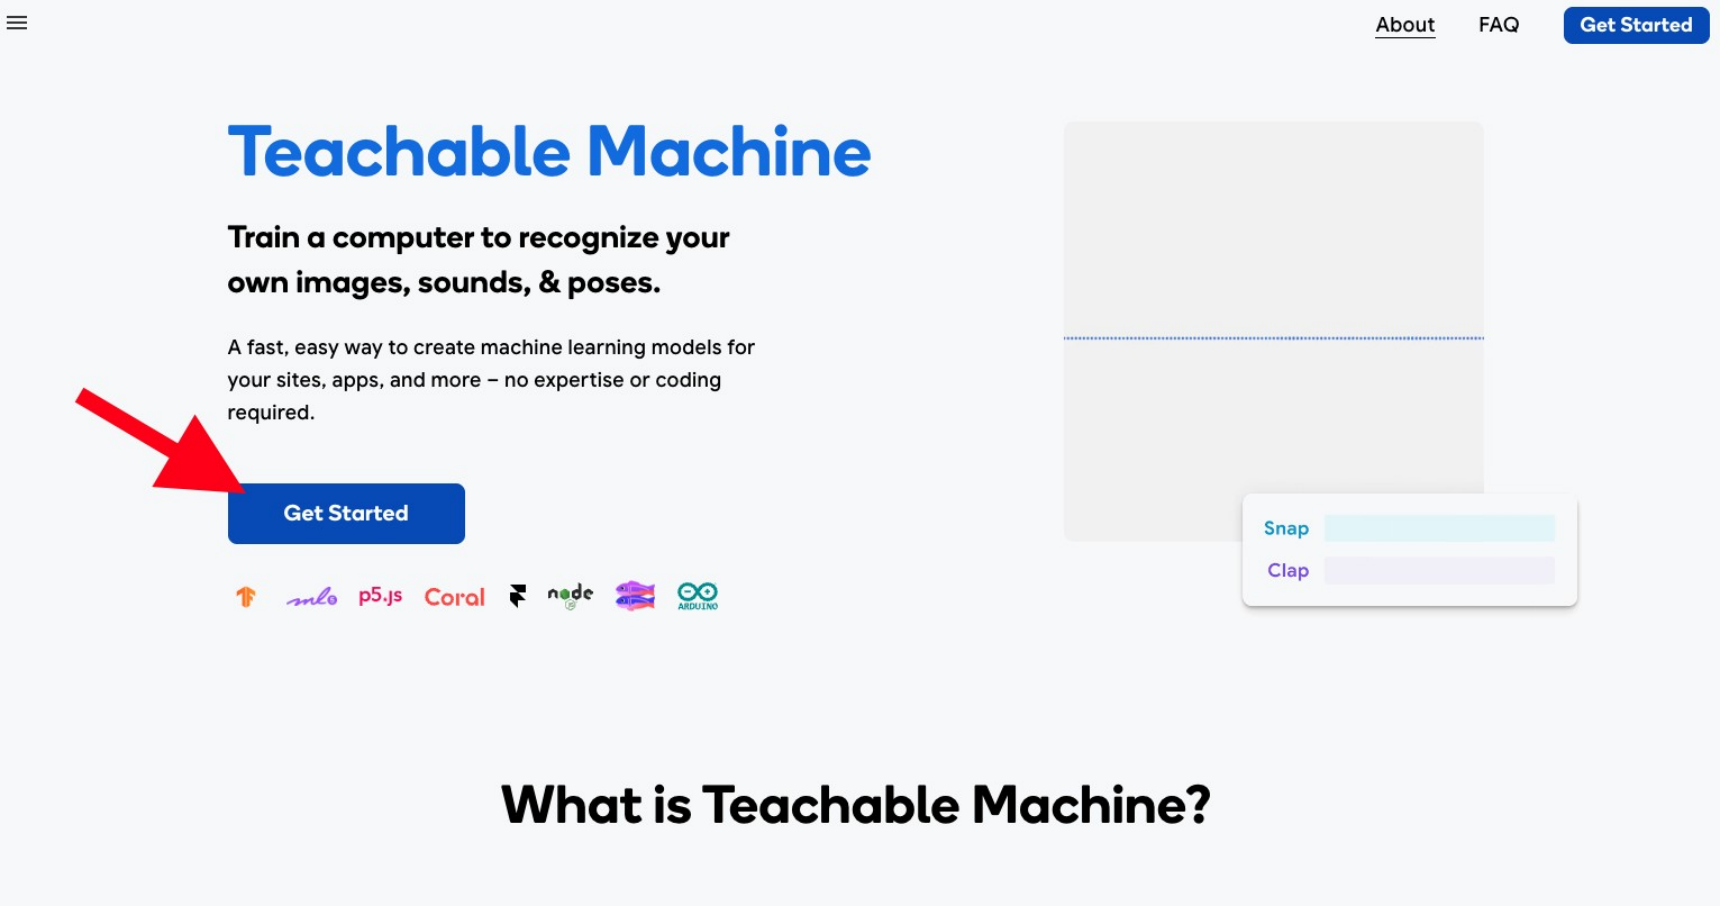
At a glance

- 1. Open Teachable Machine
- 2. Start an image project
- 3. Choose the standard model
- 4. Create Rock / Paper / Scissors classes
- 5. Add sample images
- 6. Train and test
- 7. Export the model

Tip: The red arrows already show the click targets. The text here explains what each screen is for and what to do next.

Step 1. Open Teachable Machine

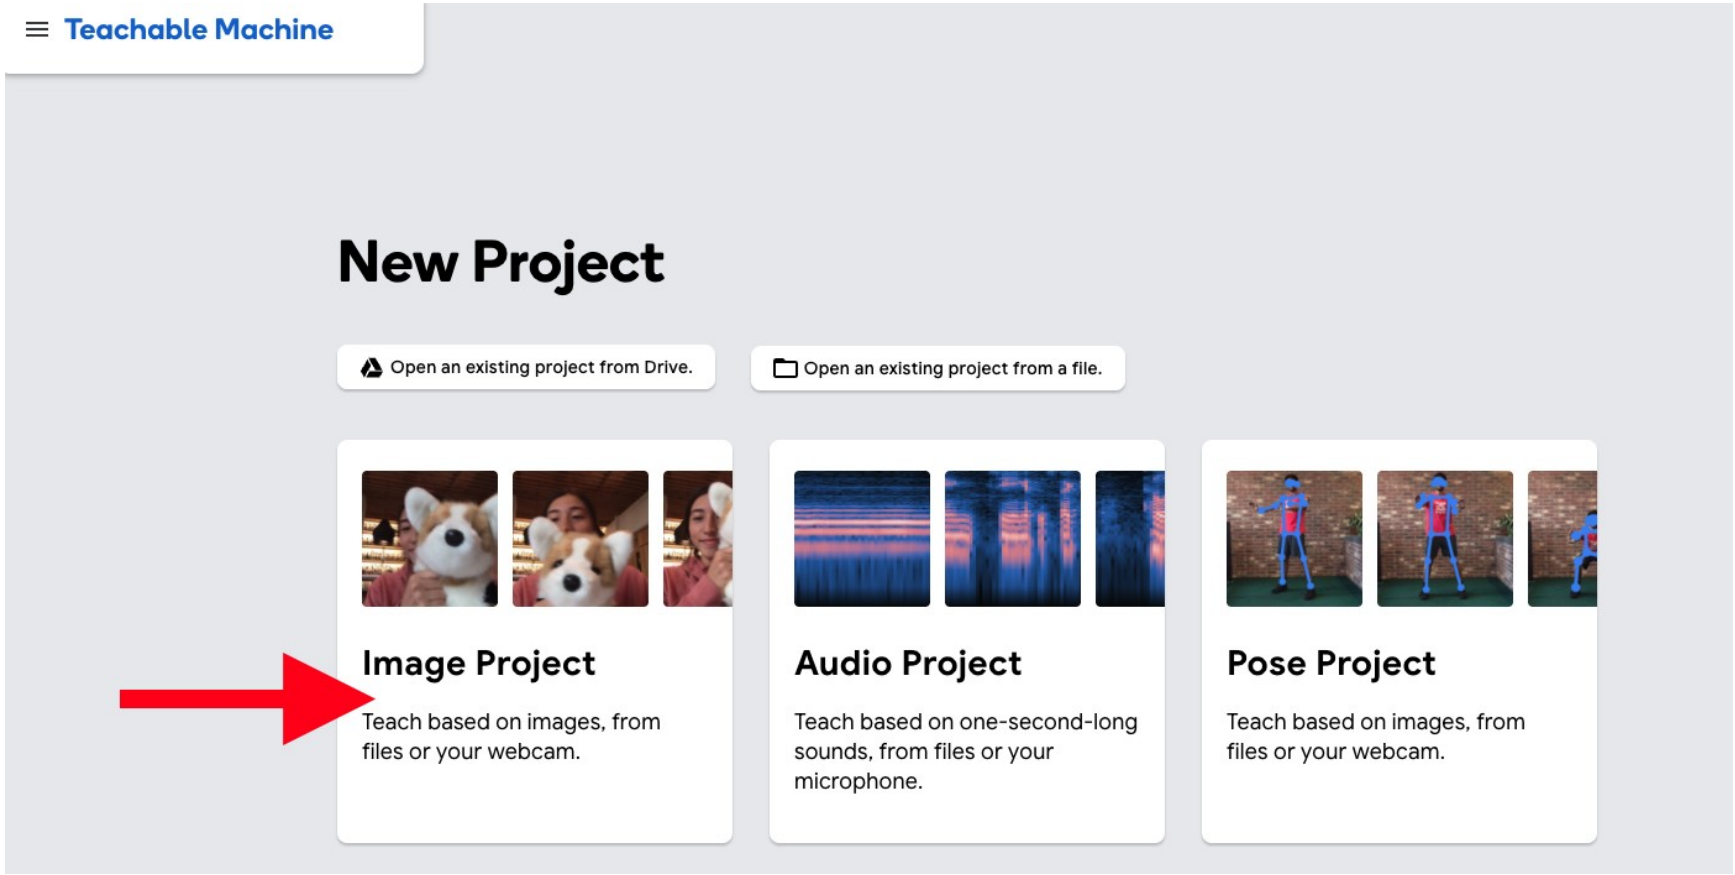
Go to the Teachable Machine website and click the blue Get Started button on the home page.



Home page with the Get Started button highlighted.

Step 2. Start a new image project

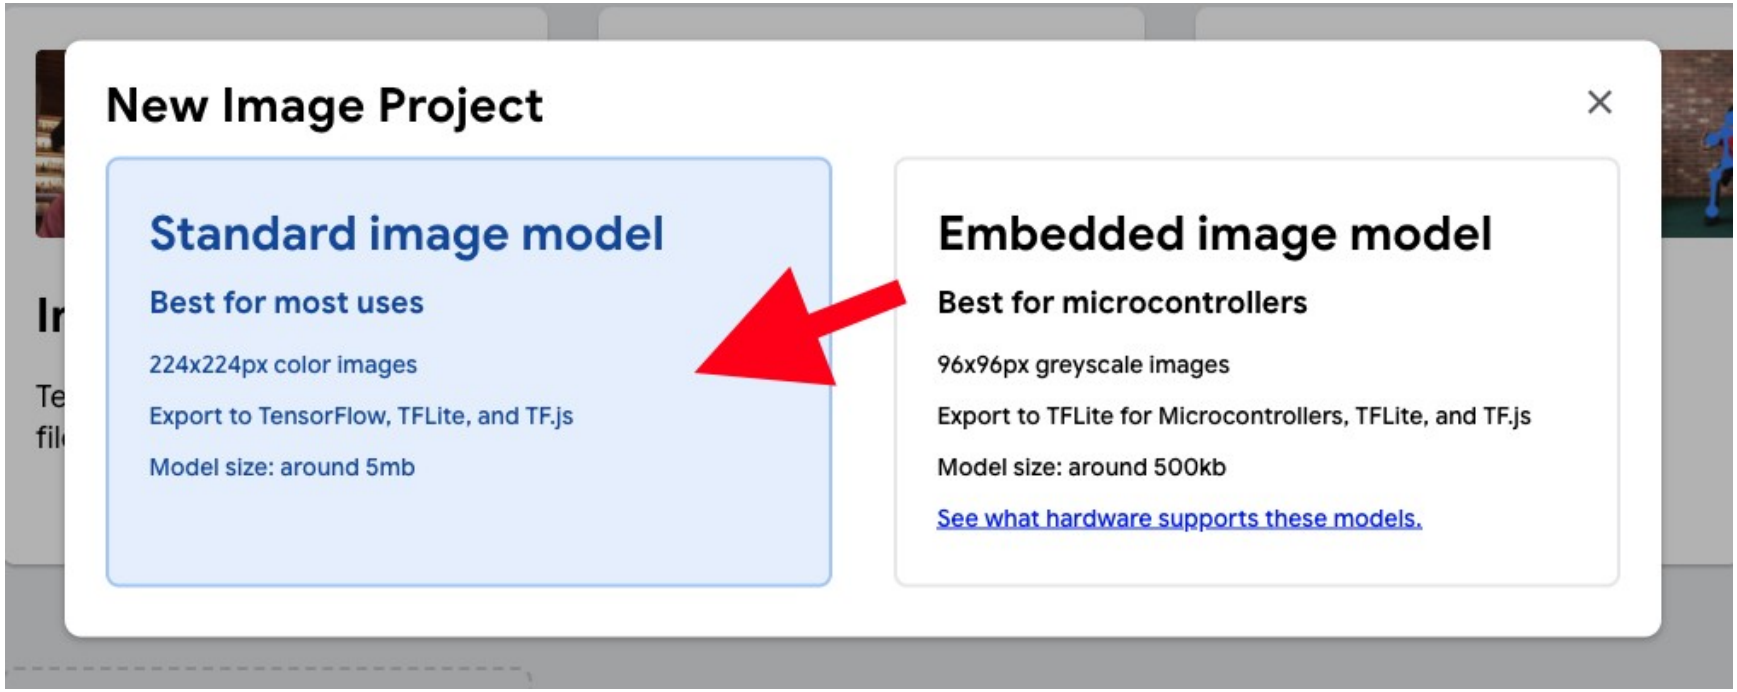
On the New Project screen, choose Image Project. This option is used for models that learn from pictures taken with a webcam or uploaded from files.



Choose Image Project to create an image-based classifier.

Step 3. Choose the standard image model

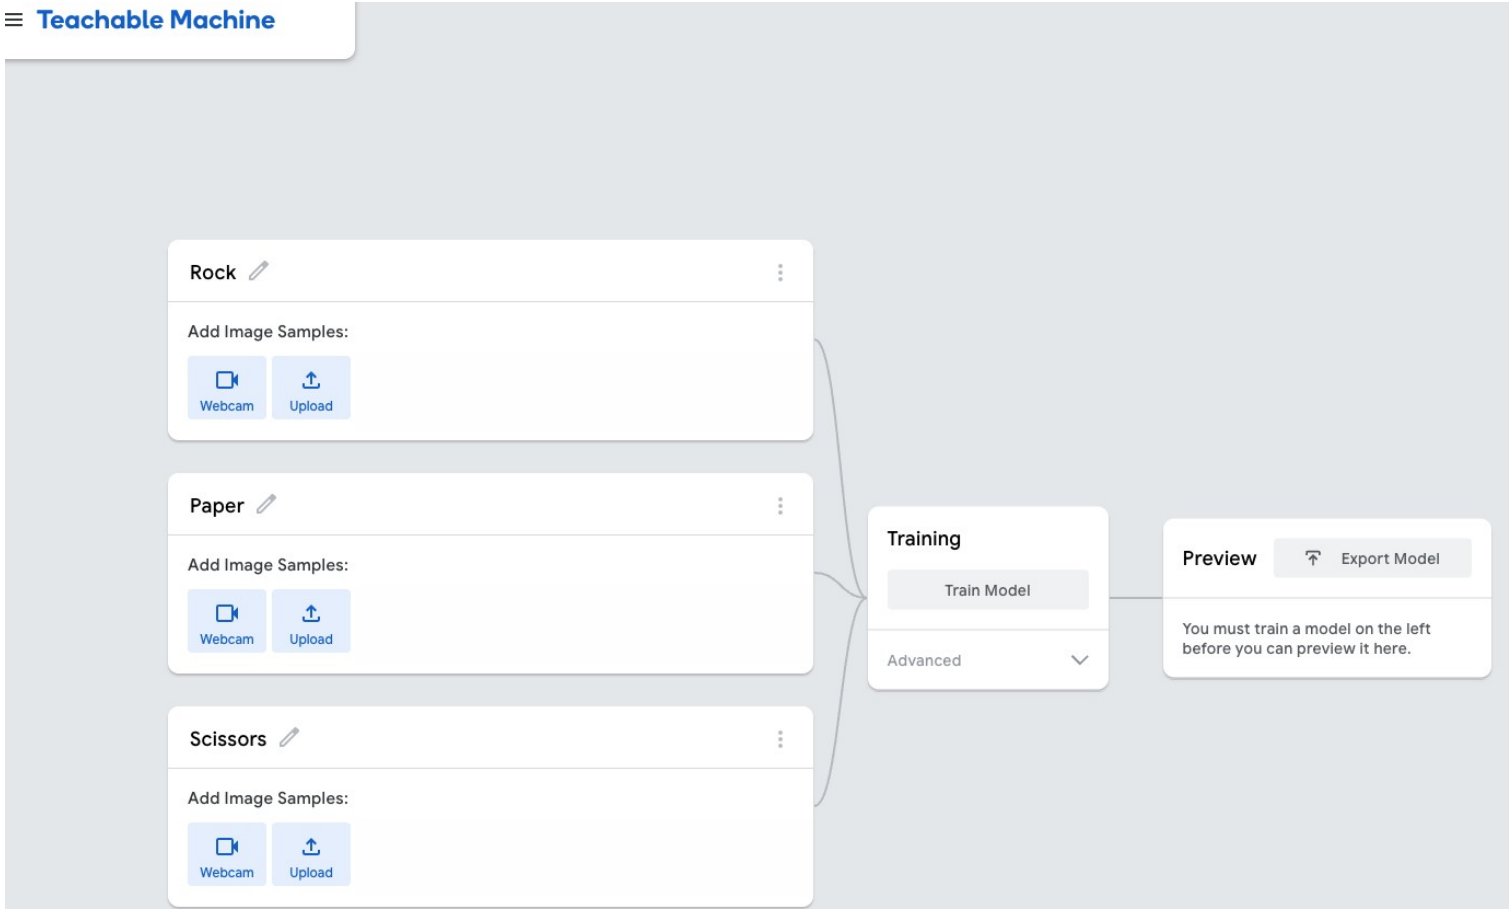
In the pop-up window, click Standard image model. This is the usual choice for a classroom Rock, Paper, Scissors activity.



Use the Standard image model for the normal workflow.

Step 4. Create your classes

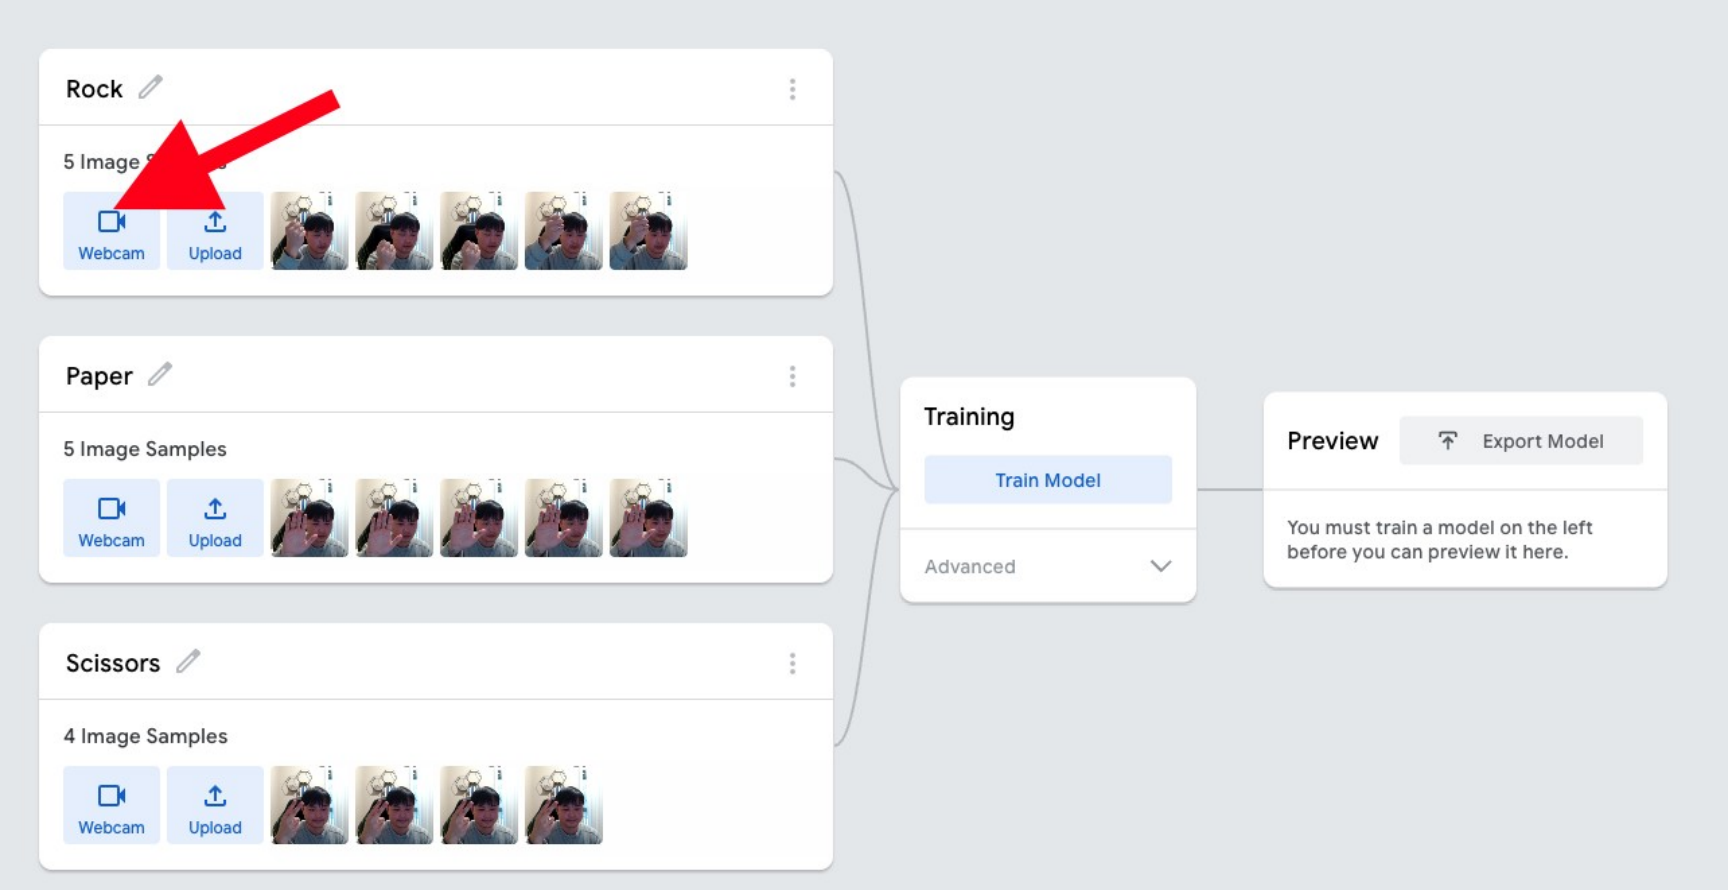
Set up three classes: Rock, Paper, and Scissors. This workspace is where you collect examples for each hand gesture before training the model.



Project workspace with Rock, Paper, and Scissors ready for data collection.

Step 5. Add sample images

For each class, use Webcam to capture examples or Upload to add saved images. Keep the number of images similar across classes and try to include small variations in angle and position.

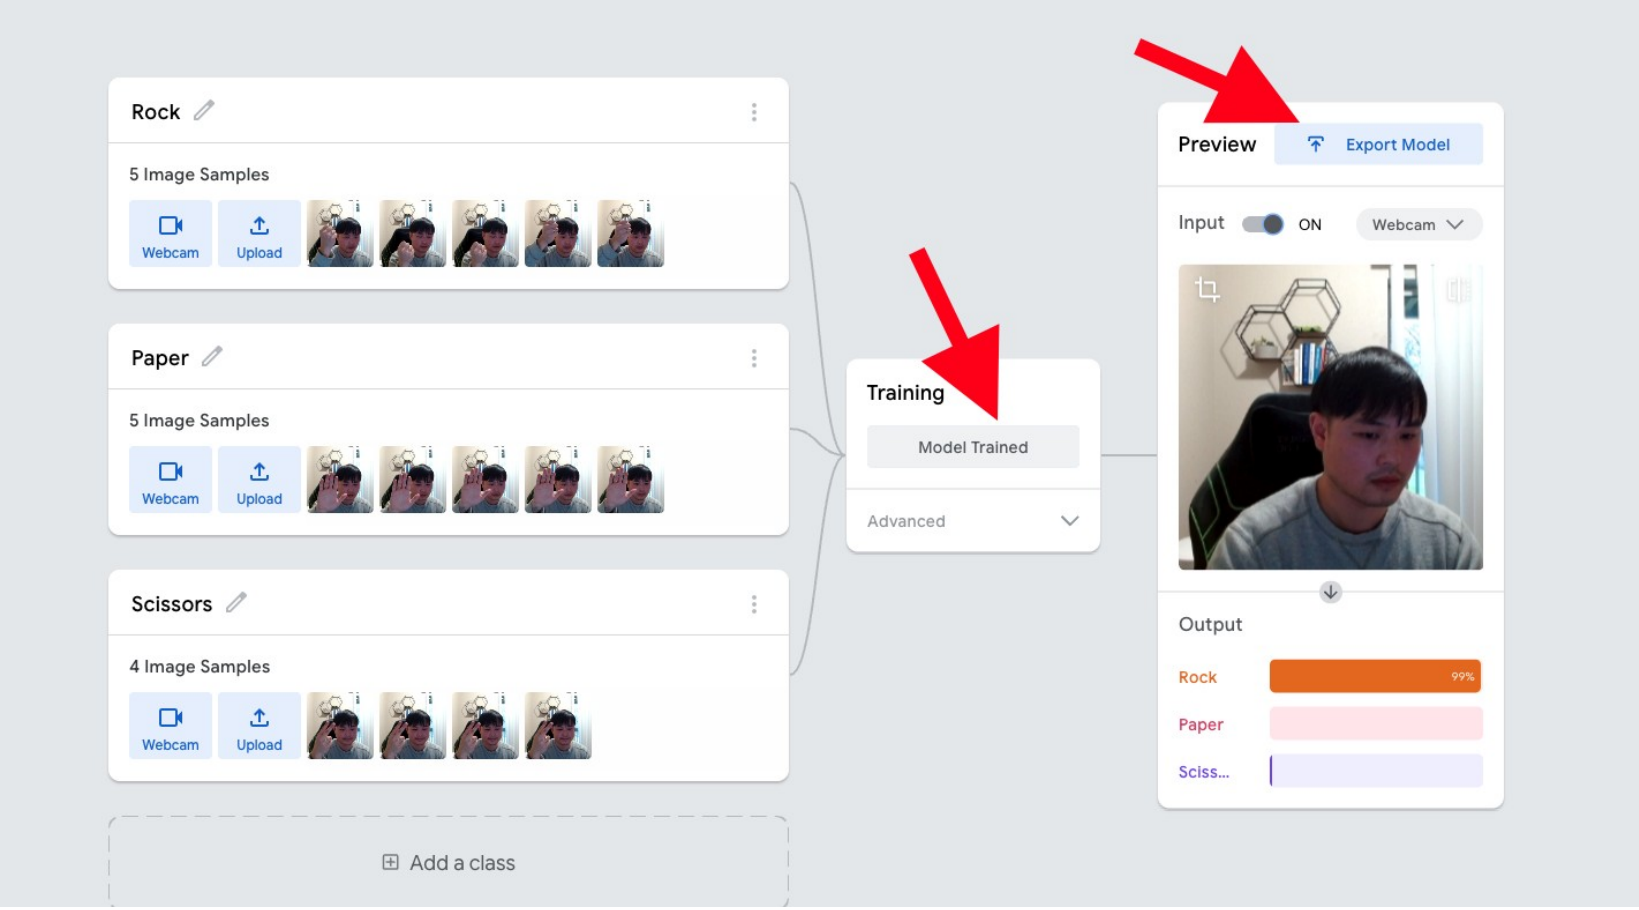


Collect sample images for each class using Webcam or Upload.

Teacher tip: A balanced dataset usually works better. Try to collect similar counts for Rock, Paper, and Scissors and avoid cluttered backgrounds when possible.

Step 6. Train and test the model

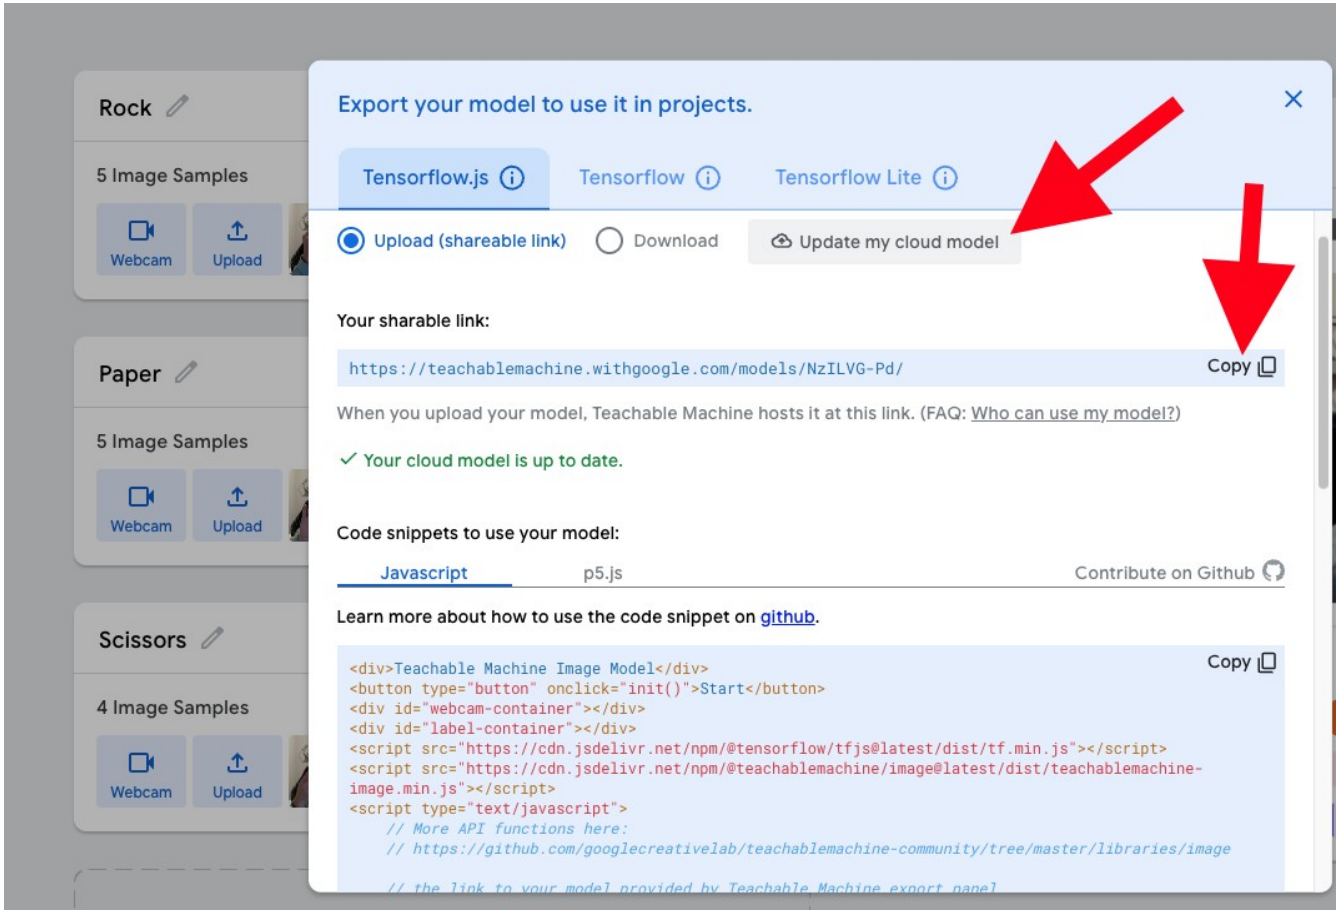
After adding images, click Train Model. When training finishes, use the Preview panel to test whether the model correctly recognizes Rock, Paper, and Scissors.



Use the Preview panel to test live predictions after training.

Step 7. Export the model

Click Export Model in the Preview panel. In the export window, copy the shareable link or the provided code snippet, depending on how you want to use the model in your project or lesson.



Export the model and copy the shareable link or code snippet.

Quick completion checklist

Use this short checklist to confirm the model setup is complete.

- ☐ Rock, Paper, and Scissors classes are all present.
- ☐ Each class has several sample images.
- ☐ The model trains successfully.
- ☐ The Preview panel shows sensible predictions.
- ☐ The export window opens and the link or code can be copied.
